Macchina controlla pelli - Leather control machine

The most time-consuming process during cutting in shoe production industry is the period of time which the cutter spends to search the faulty points on leather. Leather is stretched on our leather stretching machine before cutting; so that faults and defaults that are unable to be seen with the naked eye or disguised by processed leather are revealed and marked with a silver pen. In such a case; since faulty parts on the leather are signed beforehand, the cutter will spend concerning time for cutting instead of searching for faults and defaults on leather; and therefore the amount of production will increase by 30%.

As leather is marked by an operator who is specialized on leather and employed in the company, faulty cuts performed by less-qualified cutters will be prevented and the cut quality will be higher.

Since the leather will not be cut from faulty parts, the rate of shoes split during assembly will decrease by 90%.

Technical properties and dimensions :

Length: 1920

Width : 960

Height: 1050

Air : 5 bar

Weight : 330 kg.
